

Robert Leung

All of my resolver queries were done on a mobile hot spot connection.

Local and Google resolver queries were done with the use of dig emulator:

Google Resolver Query Times

Explanation:

A trend I noticed is that the local and Google resolvers both resolve at similar rates. Both are also much faster than the resolver I created. A common trend I in all three cases is the difference in 25th percentile, average, and 75th percentile data. My educated explanation is that DNS caching is being done on my machine. So, the first few times may often be slower than the later times recorded. Also distance affects query time as many foreign sites take a long time.
